## **LIST OF TABLES**

- Table 1: Paragraph 11(b) Proposed Sample Location Summary
- Table 2: Summary of Samples Collected
- Table 3: PFAS and Associated Analytical Methods
- Table 4A: Analytical Results – June 2019 Event
- Table 4B: Analytical Results – August 2019 Event
- Table 5A: Total Daily Precipitation – 2019 Quarter 2
- Table 5B: Total Daily Precipitation – 2019 Quarter 3

## **LIST OF FIGURES**

- Figure 1: Site Location Map
- Figure 2: Paragraph 11(b) Sample Locations
- Figure 3A: HFPO-DA, PFMOAA, and PMPA Concentrations – Locations that Reach Outfall 002
- Figure 3B: Total Table 3+ Concentrations – Locations that Reach Outfall 002
- Figure 3C: HFPO-DA, PFMOAA, and PMPA Concentrations – Locations for Offsite Disposal
- Figure 4A: Intake and Outfall 002 HFPO-DA Concentrations
- Figure 4B: Intake and Outfall 002 PFMOAA Concentrations
- Figure 4C: Intake and Outfall 002 PMPA Concentrations

## **LIST OF APPENDICES**

- Appendix A: Quarter 2 and Quarter 3 Supplemental Sampling Activities
- Appendix B: Field Parameters
- Appendix C: Re-issued Results from April 2019 Event
- Appendix D: Laboratory Reports and Data Review Narrative Whitebooks

## ACRONYMS AND ABBREVIATIONS

COC – Chain of Custody  
DEQ – The North Carolina Department of Environmental Quality  
DO – Dissolved oxygen  
DQO – data quality objectives  
DVM – Data Verification Module  
EIM – Environmental Information Management  
EPA – Environmental Protection Agency  
HDPE – High Density Polyethylene  
HFPO-DA – Hexafluoropropylene oxide dimer acid  
mg/L – Milligrams per liter  
mL – Milliliter  
MS – Matrix spike  
MSD – Matrix spike duplicates  
mV – Millivolts  
ng/L – Nanograms per liter  
NCCW – Non-contact cooling water  
NTU – Nephelometric turbidity units  
ORP – Oxidation/Reduction Potential  
PEPA – Perfluoroethoxypropyl carboxylic acid  
PFAS – Per- and polyfluoroalkyl substances  
PFESA-BP1 – Byproduct 1  
PFESA-BP2 – Byproduct 2  
PFMOAA – 2,2-difluoro-2-(trifluoromethoxy) acetic acid  
PFNA – Perfluorononanoic acid  
PFO<sub>2</sub>HxA – Perfluoro(3,5-dioxahexanoic) acid  
PFO<sub>4</sub>DA – Perfluoro(3,5,7,9-tetraoxadecanoic) acid  
PFO<sub>5</sub>DA – Perfluoro(3,5,7,9,11-pentaoxadodecanoic) acid  
PMPA – Perfluoromethoxypropyl carboxylic acid  
PPF Acid – Pentafluoropentionic acid  
QA/QC – Quality assurance/ quality control

## **ACRONYMS AND ABBREVIATIONS (CONTINUED)**

RPD – Relative percent difference  
SC – Specific conductance  
SOP – Standard Operating Procedure  
TestAmerica – TestAmerica Sacramento  
WWTP – Wastewater treatment plant  
°C – Degrees Celsius  
µmho - micromhos

"I certify that I am personally familiar with the information contained in this submittal, including any and all supporting documents accompanying this report, and that the material and information contained herein is, to the best of my knowledge and belief, true, accurate and complete."

## 1. INTRODUCTION

This report was prepared by Geosyntec Consultants of NC, P.C. (Geosyntec) for The Chemours Company FC, LLC (Chemours) to provide a quarterly update on the identification and concentrations of per- and polyfluoroalkyl substances (“PFAS”) in process wastewater, non-process wastewater, and stormwater at the Chemours Fayetteville Works, North Carolina site (the Facility, Figure 1). This report is prepared pursuant to Paragraph 11(c) in the executed Consent Order entered February 25, 2019 between Chemours and the North Carolina Department of Environmental Quality (DEQ) with the Cape Fear River Watch as intervenor.

This is the second quarterly report addressing Paragraph 11(c) of the Consent Order. The objective of this report and subsequent quarterly reports, as stated in the PFAS Characterization Sampling Plan (Geosyntec, 2019a), is to characterize the concentrations of PFAS in the raw water intake, process wastewater, non-process wastewater, and stormwater, including water that is discharged through Outfall 002.

### 1.1 Background

Chemours submitted an Updated PFAS Characterization Sampling Plan (the Plan) to DEQ on May 6, 2019 (Geosyntec, 2019a) based on comments received on the draft plan submitted on December 30, 2018. On June 19, 2019, DEQ provided written approval of the Plan to Chemours.

The first quarterly report for this program was submitted on July 31, 2019 (Geosyntec, 2019b) and contained data for the Quarter 2 2019 period (April, May and June). The first bimonthly PFAS characterization sampling event took place on April 24, 2019 (the April 2019 event). Samples were also collected on June 27 and June 28, 2019 (the June 2019 event), but data were pending at the time of submission of the first report. The June 2019 event PFAS characterization data are reported and discussed herein.

Four supplementary sampling activities, based on initial observations from the April sampling event, were also conducted in Quarter 2 2019 and during the Quarter 3 2019 period (July, August, September). These additional sampling activities were described in the first quarterly report (Geosyntec 2019b) and included: (i) a wastewater treatment plant (WWTP) sampling event (conducted in July 2019); (ii) a conveyance network sampling event (conducted in July 2019); (iii) an open channel to Outfall 002 sampling event (conducted in May 2019); and (iv) a soil sampling event (conducted in July 2019). Data from these activities were pending at the time of submission of the first quarterly report. Results and discussion for the first three sampling programs (WWTP sampling event, the

conveyance network sampling event, and the open channel sampling event) are provided in Appendix A. The fourth sampling program of soil sampling was conducted to support rainfall analyses and as such is not directly related to the scope of activities addressing Paragraph 11(b) of the Consent Order and will be provided under separate cover.

## **1.2 Activities Completed for this Quarterly Report**

The activity period for this quarterly report includes Quarter 3 2019 (July, August, and September 2019) as well as some of Quarter 2 2019 where data was not yet available for the previous quarterly report (Geosyntec, 2019b). Table 1 provides a summary of the proposed sample locations to be collected at the Facility (Geosyntec, 2019a). In this quarter, process wastewater and non-process wastewater samples were collected for the third bimonthly PFAS characterization sampling event on August 21 and August 22, 2019 (the August 2019 event). These samples were collected as outlined in the PFAS Characterization Sampling Plan (Geosyntec, 2019a) and to address requirements specified in Paragraph 11(b) in the executed Consent Order. While there were suitable storm events for sampling in the month of August 2019, the sampling event did not occur during a storm event because (1) the project team collected stormwater grab samples during storm events to support efforts under Paragraph 12 of the Consent Order, and (2) lightning during suitable storm events prohibited sample collection due to health and safety concerns.

In accordance with the PFAS Characterization Sampling Plan (Geosyntec, 2019a), four grab samples each were taken at Locations 18 (Kuraray process water) and 23A (manhole on the Terra Cotta Pipe) in the August 2019 event. The grab samples were taken at one-hour intervals to determine whether a temporal composite sample was necessary in these locations or, if results were consistent over time, grab samples would be deemed sufficient.

## **1.3 Report Organization**

The remainder of this document is organized as follows:

- **Section 2 – Methods:** this section describes the methods employed for sample collection and analysis;
- **Section 3 – Results and Observations:** this section describes the PFAS concentrations in investigative samples and quality control samples;

- **Section 4 – Sampling Program Status:** this section describes planned sampling activities and supplemental sampling activities that support PFAS characterization at the Facility;
- **Section 5 – Summary and Recommendations:** this section summarizes activities conducted, observations of results, recommended supplemental sampling activities, and any recommended changes to the sampling plan; and
- **Section 6 – References:** this section lists the documents referenced in the report.

## 2. METHODS

This section describes the methods implemented for data reported in this 2019 Quarter 3 report. Activities conducted in Quarter 2 where data were not yet available to be included in the Quarter 2 report are also described alongside data for Quarter 3 activities.

### 2.1 Sample Locations

Proposed sample locations outlined in the PFAS Characterization Sampling Plan (Geosyntec, 2019a) to meet the requirements of Paragraph 11(b) of the executed Consent Order are described in Table 1 and shown in Figure 2.

In the June 2019 event, twenty-three (23) investigative samples were collected (locations listed in Table 2). Locations 2, 3, 4, 5, 10, 11, 12 and 13 were not sampled for the June 2019 event as there was insufficient water at these locations during the sampling event; or there was no precipitation in the 72 hours leading up to sample collection. During each sampling event, either Location 21A or 21B (the south and north sediment ponds) is sampled depending on which sediment pond is active. The south sediment pond (Location 21A) was active during the June event and a sample was collected from this pond.

In the August 2019 event, twenty-seven (27) investigative samples were collected (locations listed in Table 2). Locations 2, 3, 4, 5, 11, and 13 were not sampled for the August 2019 event as there was insufficient water at these locations during the sampling event; or there was no precipitation in the 72 hours leading up to sample collection. As noted above, during each sampling event, either Location 21A or 21B is sampled depending on which sediment pond is active. The south sediment pond (Location 21A) was active during the August event and a sample was collected from this pond. Four grab samples were taken at Locations 18 and 23A. The grab samples were collected to evaluate whether results were consistent over time and thereby representative with a single grab sample versus requiring a temporal composite sample.

As specified in the PFAS Characterization Sampling Plan (Geosyntec, 2019a), sample collection will be conducted bimonthly, and if there are no suitable storm events, locations with water will still be sampled.

## **2.2 Field Methods**

### **2.2.1 General Field Methods**

All equipment was inspected by the field program supervisor and calibrated daily prior to use in the field according to the manufacturer's recommendations. Field parameters were measured with a water quality meter prior to sample collection and then recorded. Field parameters include the following:

- pH;
- Temperature (degrees Celsius; °C);
- Specific conductance [SC] (micromhos,  $\mu$ mho);
- Dissolved oxygen [DO] (milligrams per liter; mg/L);
- Oxidation/Reduction Potential [ORP] (millivolts; mV);
- Turbidity (nephelometric turbidity units, NTU);
- Color; and
- Odor.

Samples were collected in 250 milliliter (mL) high density polyethylene (HDPE) bottles with a wide-mouth screw-cap. Sample bottles were filled and caps were securely fastened after sample collection. Each sample was labelled with a unique sample identification number, date, time and location of sampling, and the initials of the individual collecting the sample. A field notebook was used to record information regarding additional items such as quality assurance/ quality control (QA/QC), sample identifications, color, odor, turbidity, and other field parameters.

### **2.2.2 Decontamination Methods**

Sample containers were new and used only once for each sample. Disposable equipment (e.g., gloves, tubing, etc.) was not reused, therefore; these items did not require decontamination.

All non-dedicated or non-disposable sampling equipment (i.e., the autosampler reservoir and dip rod) was decontaminated immediately before sample collection in the following manner:

- De-ionized water rinse;
- Scrub with de-ionized water containing non-phosphate detergent (i.e., Alconox®); and
- De-ionized water rinse.

If there was a delay between decontamination and sample collection, decontaminated sampling equipment was covered with PFAS-free plastic until it was ready for use.

### **2.2.3 Grab Sampling Methods**

Grab samples were collected during the June 2019 and August 2019 events from locations where temporal variability over the course of one day was not expected. These locations include non-process wastewater and process wastewater samples and are identified in Table 2 and shown on Figure 2. Location 7B was also collected as a grab sample during the June 2019 event due to limited autosampler availability; it was collected as a composite sample for the August 2019 event and will be collected in this manner in the future. All grab samples were collected by directly filling the HDPE bottle with sample. Prior to grab sample collection, field parameters were measured using a flow through cell for all grab sample locations except Chemours Process Water samples at Locations 16, 17A, and 17B. These locations were not accessible by the sampling team and samples were collected by facility staff who were not equipped with field instruments.

### **2.2.4 Temporal Composite Sampling Methods**

Temporal composite samples were collected during the June 2019 and August 2019 events from locations where variability was expected to potentially be significant within a short time frame (e.g., one day). These locations, identified in Table 2 and shown on Figure 2, include those within the Facility conveyance network and the intake and outfall locations, since these locations can have highly variable dissolved and suspended constituent loads over short time periods. Temporal composite samples were collected using a dedicated Teledyne 6712C autosampler equipped with a rain gauge, HDPE tubing, silicon tubing, and an HDPE sample reservoir. Field parameters were measured twice for temporal composite samples: once during composite sampling (collected directly from the water stream), and once after composite sampling (collected from the autosampler reservoir). At each location, autosamplers integrated water over a four-hour sample collection period.

### **2.2.5 Sample Shipping, Chain of Custody, and Holding Times**

Upon sample collection, each labelled, containerized sample was placed into a plastic bag inside an insulated sample cooler with ice. Prior to shipment of the samples to the laboratory, a chain of custody (COC) form was completed by the field sample custodian. Sample locations, sample identification numbers, description of samples, number of samples collected, and specific laboratory analyses to be performed on the samples were

recorded on the COC form. The COC was signed by the field personnel relinquishing the samples to the courier and was signed by the laboratory upon receipt of the cooler.

### **2.2.6 Field QA/QC Samples**

The following field QA/QC samples were collected and analyzed along with the June 2019 investigative samples:

- Two blind field duplicates;
- Two equipment blanks for the peristaltic pump and autosampler;
- One field blank; and
- One trip blank.

The following field QA/QC samples were collected and analyzed along with the August 2019 investigative samples:

- Two blind field duplicates;
- Three equipment blanks for the dip rod, peristaltic pump, and autosampler;
- One field blank; and
- One trip blank.

### **2.2.7 Documentation**

The project field team kept a daily record of field activities during the execution of field work including sampling notes and observations, instrument calibration records, measured field parameters, sample COC, and shipping records.

## **2.3 Laboratory Methods**

### **2.3.1 Analytical Methods**

Samples were analyzed for PFAS by the following methods:

- Table 3+ Laboratory Standard Operating Procedure (SOP); and
- EPA Method 537 Mod (Laboratory SOP).

PFAS reported under each of these methods are listed in Table 3.

### **2.3.2 Laboratory and Field QA/QC**

Field sampling and laboratory analyses were performed in accordance with the PFAS Characterization Sampling Plan (Geosyntec, 2019a). Samples were collected by the field team and shipped to TestAmerica Sacramento (TestAmerica) under COC. Laboratory analyses were performed within the guidelines specified by the laboratory SOPs. The collection frequency of field duplicates, matrix spike / matrix spike duplicates (MS/MSD), trip blanks, and equipment blanks was largely in accordance with the PFAS Characterization Sampling Plan (Geosyntec, 2019a), and deviations, listed below, were acceptable since previous QA/QC samples have met criteria.

An equipment blank was not collected for the dip rod in the June 2019 event. Equipment blanks collected for the dip rod in the April 2019 event and the August 2019 event were non-detect for all PFAS except 2-(N-ethyl perfluoro-1-octanesulfonamido)-ethanol in the April 2019 event. This is discussed further in the first quarterly report (Geosyntec, 2019b).

### 3. RESULTS AND OBSERVATIONS

#### 3.1 Data Quality

All data were reviewed using the Data Verification Module (DVM) within the Locus™ Environmental Information Management (EIM) system, which is a commercial software program used to manage data. Following the DVM process, a manual review of the data was conducted. The DVM and the manual review results were combined in a data review narrative report for each set of sample results which were consistent with Stage 2b of the EPA Guidance for Labelling Externally Validated Laboratory Analytical Data for Superfund Use (EPA-540-R-08-005 2009). The narrative report summarizes which samples were qualified (if any), the specific reasons for the qualification, and any potential bias in reported results. The data usability, in view of the project's data quality objectives (DQOs), was assessed and the data were entered into the EIM system.

The data were evaluated by the DVM against the following data usability checks:

- Hold time criteria;
- Field and laboratory blank contamination;
- Completeness of QA/QC samples;
- MS/MSD recoveries and the relative percent differences (RPDs) between these spikes;
- Laboratory control sample/control sample duplicate recoveries and the RPD between these spikes;
- Surrogate spike recoveries for organic analyses; and
- RPD between field duplicate sample pairs.

The manual review includes instrument-related QC results for calibration standards, blanks, and recoveries. The data review process (DVM plus manual review) applied the following data evaluation qualifiers to analysis results, as warranted:

- J – Analyte present. Reported value may not be accurate or precise;
- UJ – Analyte not detected. Reporting limit may not be accurate or precise;
- B – Analyte detected in a blank sample. Reported value may have high bias; and
- I – Value is estimated at maximum concentration.

The data review process described above was performed for all laboratory chemical analysis data generated for the sampling events. The DQOs were met for the analytical

results for accuracy and precision. The data collected are believed to be complete, representative, and comparable.

### **3.1.1 Data Management and Reporting**

Chemours's Analytical Data Quality Management team currently uses the EIM system for management of analytical data, xyz Site coordinate data, and field parameter data. Validation and qualification of data are performed by AECOM who maintains the EIM system for the Chemours Fayetteville Site. Whitebooks consisting of the data review narratives and the laboratory analytical reports produced by AECOM summarize the findings of the DVM and manual review process.

### **3.1.2 QA/QC Samples**

PFAS concentrations for all field QA/QC samples in the June 2019 and August 2019 events are reported in Tables 4A and 4B, respectively. The following observations were noted for the QA/QC samples:

- The RPD for field duplicate pairs in the June 2019 event was less than 20% for all PFAS, except for Byproduct 4, PFOA, and PFOS at Location 24A, which had 74% RPD, 22% RPD, and 55% RPD, respectively. The reported result for these three analytes in the duplicate pair at Location 24A may be imprecise and were J qualified.
- No PFAS were detected above the associated reporting limits in the equipment blanks for the June 2019 event.
- No PFAS were detected above the associated reporting limits in the June 2019 Trip Blank.
- No PFAS were detected above the associated reporting limits in the June 2019 Field Blank.
- The RPD for the field duplicate pairs in the August 2019 event was less than 20% for all PFAS, except for Hexafluoropropylene oxide dimer acid (HFPO-DA) at Location 20, which had an RPD of 37%. The reported results for HFPO-DA in the duplicate pair at Location 20 may be imprecise and were J qualified.
- No PFAS were detected above the associated reporting limits in the equipment blanks for the August 2019 event, except for perfluoroundecanoic acid, detected

at the reporting limit (2 nanograms per liter, ng/L) in the equipment blank collected using the peristaltic pump. Since this detection was at the reporting limit, no qualification was needed.

- No PFAS were detected above the associated reporting limits in the August 2019 Trip Blank.
- No PFAS were detected above the associated reporting limits in the August 2019 Field Blank.

### **3.2 Investigative Sample Results**

PFAS concentrations for all sample locations in the June 2019 and August 2019 events are provided in Tables 4A and 4B, respectively. Figure 3A presents HFPO-DA, 2,2-difluoro-2-(trifluoromethoxy) acetic acid (PFMOAA), and perfluoromethoxypropyl carboxylic acid (PMPA) concentrations for locations in the April 2019, June 2019 and August 2019 events that reach Outfall 002. Figure 3B presents the Total Table 3+ concentrations for locations in the April 2019, June 2019, and August 2019 events that reach Outfall 002. Figure 3C presents HFPO-DA, PFMOAA, and PMPA concentrations for locations in the April 2019 and June 2019 events where Chemours process wastewater is shipped offsite for disposal. Samples were not collected from these locations during the August 2019 event. Tables 5A and 5B provide the total daily precipitation in the area of the Facility at the times of sampling events discussed in this report. Reporting limits listed in Table 4A, Table 4B, Figure 3A, and Figure 3B are analytical reporting limits set by the laboratories.

Three supplementary sampling activities were also conducted in 2019 Quarter 2 and Quarter 3 related to Paragraph 11(c) of the Consent Order. These activities included a WWTP sampling event, a conveyance network sampling event, and an open channel to Outfall 002 sampling event. Data from these activities are provided in Appendix A. Field parameter data are provided in Appendix B. TestAmerica analytical reports and the data review narrative whitebooks are provided in Appendix D.

### **3.3 Reporting Limits**

As noted in Quarterly Report #1, there were several PFAS compounds with elevated reporting limits in the April and June 2019 sample events. These samples were submitted to the laboratories for reanalysis of Table 3+ compounds at low-level analysis to achieve lower reporting limits. Table 1A and Figures 3A, 3B, and 3C reflect all re-issued results to date from the June 2019 event. The re-issued results from the April 2019 event are

provided in Appendix C and are also reflected on Figures 3A, 3B, and 3C. Any further re-issued results will be provided in subsequent quarterly reports.

### **3.4 Observations – June 2019 Event**

The following observations were made for PFAS concentrations reported from the samples collected for the June 2019 event:

- Fourteen (14) PFAS were detected in the sample collected at Location 1, the intake water from the Cape Fear River, including HFPO-DA at 18 ng/L, which was slightly higher than what was reported during the April 2019 event. These 14 PFAS were generally observed in all other locations that derive water from the intake water.
- Similar to the April 2019 sampling event, the highest PFAS concentrations at the Facility were reported in samples collected at Locations 16, 17A, and 17B (Figure 3C). These locations are process wastewater that is taken offsite for disposal. Process wastewater at these sample locations does not reach Outfall 002.
- Similar to the April 2019 sampling event, the June samples collected from the non-process wastewater only Locations (6A, 6B, 24A, 24B, and 24C) contained low levels of HFPO-DA (ranging from 10 to 66 ng/L) and non-detect values below the 5 ng/L reporting limit for PFMOA. PMPA was detected at each location ranging from 14 ng/L to 30 ng/L, which is similar to the concentration detected at Location 1 (23 ng/L).
- Samples that contained both non-process wastewater and stormwater (Locations 7A, 9, 14, 15, and 21A) were generally detected at higher concentrations than the non-process wastewater only locations. HFPO-DA ranged from 22 to 77 ng/L, PFMOAA ranged from not detected (with reporting limits varying from 5 ng/L to 21 ng/L) to 12 ng/L, and PMPA ranged from not detected (with a reporting limit of 57 ng/L) to 33 ng/L.
- Locations 6A (non-process wastewater) and Locations 9, 15, and 21A (stormwater and non-process wastewater) had elevated HFPO-DA concentrations (40 to 77 ng/L) compared to the HFPO-DA concentration measured from the intake water at Location 1 (18 ng/L); all other Locations not containing process wastewater had HFPO-DA concentrations within 10 ng/L or lower than the intake water at Location 1 (Figure 3A).

- The sample collected from Location 23A, the manhole on the Terra Cotta pipe (Figure 3A), had lower HFPO-DA and PFMOAA concentrations than what was reported during the April 2019 event. The sample collected from Location 23A had concentrations of HFPO-DA at 170 ng/L (37% lower than April 2019) and PFMOAA at 320 ng/L (75% lower than April 2019). Conversely, PMPA was measured at 1,300 ng/L, which was an 86% increase from the April 2019 event. An analysis of four grab samples over time during the August 2019 event as described in the PFAS Characterization Sampling Plan (Geosyntec, 2019a) was conducted to assess this observation in more detail (see August 2019 event summary in Section 3.5 below).
- During the April 2019 event, PFMOAA was not detected above the reporting limit of 210 ng/L at Location 22, the influent to the WWTP, but was reported at 1,200 ng/L (J-qualified) at Location 8, the effluent of the WWTP. During the June 2019 event, the PFMOAA concentration at Location 22 was detected at 220 ng/L (J qualified); the PFMOAA concentration at Location 8 was not detected and was analyzed under the low-level analysis with a reporting limit of 21 ng/L. HFPO-DA and PMPA were also detected at higher concentrations in the sample collected at Location 22 than at Location 8 (Figure 3A). The supplemental WWTP sampling event during July 2019 was conducted to assess this observation in more detail (see Appendix A).
- The highest HFPO-DA concentration not related to process wastewater during the June 2019 event was in the sample collected at Location 9 (77 ng/L), at the Chemours Monomers IXM Non-Contact Cooling Water (NCCW) and stormwater discharge within the cooling water channel. This section of the channel receives stormwater from Vinyl Ethers South and Vinyl Ethers North and has some sediment present in the drainage ditch (Figure 3A), similar to Location 10, which had the highest reported HFPO-DA concentration in the April 2019 event and was dry during the June 2019 event. Supplemental sediment sampling and cooling water channel sampling activities were conducted in July 2019 to assess this observation in more detail (see Appendix A).
- The sample collected at Location 20 (Outfall 002) had detectable concentrations of HFPO-DA (50 ng/L), PFMOAA (48 ng/L), and PMPA (30 ng/L) (Figure 3A). The Location 20 HFPO-DA concentration (50 ng/L) was higher than the samples collected at the two streams of water that combined to form the total flow at Location 20: Location 7B, Open Channel after the WWTP (18 ng/L), and Location 15, Cooling Water Channel water before it joins the open channel to

Outfall 002 (45 ng/L). This is consistent with what was observed in the April 2019 event. The PMPA concentration at Location 20 was also higher than the concentrations of Locations 7B and 15, as well. PFMOAA was observed at a lower concentration at Location 20 (48 ng/L) than at Location 7B (69 ng/L). The drainage pathways from the DuPont areas had no observed flow during this dry event. A supplemental sampling activity was conducted in May 2019 to assess PFAS concentrations in the Open Channel to Outfall 002 in more detail (see Appendix A and summary below).

- Other PFAS concentrations were typically non-detect or detected at similar values to the intake water at Location 1 in samples collected at all locations in the June 2019 event, with the following general exceptions (Table 4A):
  - PFMOAA, perfluoroethoxypropyl carboxylic acid (PEPA), perfluorononanoic acid (PFNA), Byproduct 1 (PFESA-BP1), and Byproduct 2 (PFESA-BP2) were not detected in the sample collected from the intake water at Location 1 but were detected at three or more locations elsewhere on the site (Table 4A).
  - Multiple PFAS were detected in the water samples collected at Location 23A, the manhole at the Terra Cotta pipe, and 23B, the Kuraray laboratory process wastewater discharge, that were not detected at Location 1, the intake (Table 4A).
  - The water samples collected at Locations 7B, 8, 9, 20, 22, 23A, and 23B each had several PFAS concentrations that were greater than those reported at Location 1, the intake (Table 4A). Chemours conducted supplemental sampling activities in May 2019 and July 2019 to assess these detections (see Appendix A).
  - PFESA-BP1 was detected in elevated concentrations at Location 9 (2,300 ng/L; the Chemours Monomers IXM NCCW and stormwater discharge) and Location 15 (880 ng/L; combined NCCW and stormwater discharge from eastern portion of the facility), contributing to higher Total Table 3+ concentrations at both locations (Figure 3B, Table 4A). Location 9 is upstream of Location 15; the source of PFESA-BP1 observed during these two sampling events may be related.
  - Byproduct 5 was detected at elevated concentrations at the combined influent to the WWTP (Location 22; 13,000, J qualified) that were not

observed in upstream locations. The concentration of Byproduct 5 at Location 8, the effluent to the WWTP, was also elevated at 3,500 ng/L. The supplemental WWTP sampling event during July 2019 was conducted to assess this observation in more detail (see Appendix A).

### **3.5 Observations – August 2019 Event**

The following observations were made for PFAS concentrations reported from the samples collected for the August 2019 event:

- Seventeen (17) PFAS were detected in the sample collected at Location 1, the intake water from the Cape Fear River, including HFPO-DA at 30 ng/L, which was higher than what was reported during the April 2019 and June 2019 events. These 17 PFAS were generally observed in all other locations that derive water from the intake water.
- Four grab samples were collected over four hours at one-hour intervals at Location 18, the process wastewater from the Kuraray area, to determine whether a temporal composite sample was needed to capture potential PFAS variation over time at this location. The variability between the four samples collected at Location 18 was most notable when comparing Sample 4 to the other three samples (Table 4B). Samples 1, 2, and 3 had some variability but generally had consistent concentrations within 50% of each other. PFAS concentrations measured within Sample 4 were consistently 2 to 10 times greater than the other three samples.
- The highest PFAS concentrations observed in the process discharge areas were generally reported in samples collected at Location 23A, the manhole at the Terra Cotta pipe (Figure 3A). Four grab samples were collected at hourly intervals, over four hours to determine whether a temporal composite sample was needed to capture potential PFAS variation over time at this location. All four samples had PFAS concentrations higher than those reported for samples collected at other locations. The samples collected from Location 23A have higher HFPO-DA concentrations than what was reported during the April 2019 and June 2019 events, and ranged from 11,000 to 25,000 ng/L (average: 16,000 ng/L). PFMOAA ranged from 1,200 to 1,600 ng/L (average: 1,300 ng/L) and PMPA ranged from not detected at the 110 ng/L reporting limit to 120 ng/L. Note that process wastewater from Locations 16, 17A, and 17B had the highest PFAS concentrations during the April 2019 and June 2019 events. These locations were

not analyzed as a part of the August 2019 work plan, as recommended in Quarterly Report #1 (Geosyntec, 2019b).

- The variability between the four grab samples collected over four hours at one-hour intervals at Location 23A was most notable when comparing Sample 1 to the other three samples (Table 4B). Samples 2, 3, and 4 generally had consistent concentrations within 25% of each other. PFAS concentrations measured within Sample 1 were generally over 50% less than the other three samples. All four samples collected at Location 23A in the August 2019 event had elevated HFPO-DA compared to the April and June 2019 events. HFPO-DA concentrations at this location are also discussed in Appendix A and are being further investigated.
- Similar to the April 2019 and June 2019 events, samples from most of the non-process wastewater only locations (6A, 6B, 24A, 24B, and 24C) contained low levels of HFPO-DA (ranging from 8.9 to 19 ng/L). PFMOAA and PMPA were analyzed at lower detection limits for the August 2019 event and were also observed at low levels. PFMOAA was only detected above the 5 ng/L reporting limit at Location 24A (11 ng/L). PMPA was detected at all non-process wastewater only locations and ranged from 16 ng/L to 37 ng/L (Figure 3A).
- Samples that contained both non-process wastewater and stormwater (Locations 7A, 9, 14, 15, and 21A) generally contained PFAS at higher concentrations than the non-process wastewater only locations. HFPO-DA ranged from 13 to 57 ng/L, PFMOAA ranged from 6.9 to 25 ng/L, and PMPA ranged from 23 ng/L to 53 ng/L (Figure 3A).
- Samples collected from Locations 9 and 21A had HFPO-DA concentrations more than 10 ng/L higher than the HFPO-DA concentration measured from the intake water at Location 1; all other samples collected at locations not containing process wastewater had HFPO-DA concentrations within 10 ng/L or lower than the intake water at Location 1 (Figure 3A).
- Consistent with observations during the April 2019 event, PFMOAA was detected at lower concentrations in the sample collected at Location 22 (36 ng/L, J qualified), the influent to the WWTP, than at Location 8 (20,000 ng/L), the effluent of the WWTP (Figure 3A). HFPO-DA and PMPA were also reported at lower concentrations at Location 22 than at Location 8. The supplemental WWTP sampling event during July 2019 was conducted to assess this observation in more

detail (see Appendix A). No sediment was observed in the sample collected at Location 8 in the August 2019 event.

- The elevated PFMOAA concentration observed at Location 8 in the August 2019 event (20,000 ng/L) is a significant increase compared to the April 2019 event (1,200 ng/L, J qualified) and the June 2019 event (non-detect above the 21 ng/L reporting limit). This elevated concentration is contributing to the elevated PFMOAA concentrations observed in samples collected from downstream locations (Location 7B: 1,100 ng/L; Location 20: 650 ng/L, J qualified). Chemours is tracking PFAS concentrations at Outfall 002 (Location 20) to monitor trends. Figures 4A, 4B, and 4C provide time trends for HFPO-DA, PFMOAA, and PMPA observed at Outfall 002 to-date in 2019. While further investigation and testing is necessary, at this time it is believed that the possible cause of elevated PFMOAA observed at Outfall 001 may be linked to routine maintenance activities at the WWTP. In mid-August a clarifier was cleaned.
- Consistent with the April 2019 event, the highest HFPO-DA concentration observed within the conveyance network during the August 2019 event was in the sample collected at Location 10 (1,700 ng/L), a Chemours Monomers IXM Stormwater Discharge area. This section of the channel receives stormwater from roof drainage and has sediment present in the drainage ditch (Figure 3A). This location had insufficient water to collect a sample during the June 2019 event. Supplemental sediment sampling and cooling water channel sampling activities were conducted in July 2019 to assess this observation in more detail (see Appendix A).
- The sample collected at Location 20 (Outfall 002) had detectable concentrations of HFPO-DA (49 ng/L), PFMOAA (650 ng/L, J qualified), and PMPA (39 ng/L) (Figure 3A). Consistent with the April 2019 and June 2019 events, the Location 20 HFPO-DA concentration (49 ng/L) was higher than the samples collected at the three streams of water that combined to form the total flow at Location 20: Location 7B, Open Channel after the WWTP (42 ng/L); Location 12, drainage pathways from the DuPont Areas (17 ng/L); and Location 15, Cooling Water Channel water before it joins the open channel to Outfall 002 (43 ng/L). The PFOAA and PMPA concentrations at Location 20, however, were lower than the concentrations at Location 7B, and higher than the concentrations at Locations 12 and 15. A supplemental sampling activity was conducted in May 2019 to assess PFAS concentrations in the Open Channel to Outfall 002 in more detail (see Appendix A and summary below).

- Other PFAS concentrations were typically non-detect or detected at similar values to the intake water at Location 1 in samples collected at all locations in the August 2019 event, with the following general exceptions (Table 4B):
  - Byproduct 6, EVE Acid, Hydro-EVE Acid, PFNA, perfluoro(3,5,7,9-tetraoxadecanoic) acid (PFO4DA), and perfluor-3,5,7,9,11-pentaoxadodecanoic acid (PFO5DA) were not detected in the intake water at Location 1 but were detected at three or more locations elsewhere on the site (Table 4B).
  - Multiple PFAS were detected at Location 23A, the manhole at the Terra Cotta pipe, that were not detected at the Location 1, the intake (Table 4B).
  - The water samples collected at Locations 7B, 8, 9, 10, 15, 20, 21A, 22, 23A, and 24C each had several PFAS concentrations that were greater than those reported at Location 1, the intake (Table 4B). Chemours conducted supplemental sampling activities in May 2019 and July 2019 to assess concentrations at these locations (see Appendix A for further details).
  - Location 7B and Location 20 had greater concentrations of PFO2HxA and Byproduct 5 than samples collected at these locations in the April and June 2019 events, contributing to greater Total Table 3+ concentrations at both locations (Figure 3B, Table 4B). Location 7B is upstream of Location 20; the source of PFO2HxA and Byproduct 5 observed during these two sampling events may be related.

### **3.6 Observations – Supplemental Sampling Activities**

Refer to Appendix A for results related to the supplemental sampling activities conducted in Quarter 2 and Quarter 3.

## 4. SAMPLING PROGRAM STATUS

A description of activities planned for the next quarter and recommendations for updates to the sampling plan are provided below.

### 4.1 Activities Planned for Next Quarter

As described in the PFAS Characterization Sampling Plan (Geosyntec, 2019a), PFAS characterization samples will be collected from the Facility on a bimonthly basis. A sampling event occurred on October 9, 2019; data is currently pending. The next sampling event will occur during the first suitable storm event in December 2019. If there are no suitable storm events in the month of December, sampling will proceed and samples will be collected from locations that contain water reaching Outfall 002. Due to the temporal variability observed at Locations 18 and 23A, autosamplers that collect temporal composite samples will be used for future sampling events, pending autosampler availability ahead of the next scheduled sampling event. The next quarterly report will be submitted in January 2020 and will provide results for any Paragraph 11(c) samples described in Table 1 available at the time of reporting.

## 5. SUMMARY AND RECOMMENDATIONS

Pursuant to Consent Order Paragraph 11(c), Chemours conducted bimonthly characterization sampling activities in 2019 Quarter 3 and these results are presented in this report. Data from the June 2019 Paragraph 11(c) bimonthly sampling event that was pending when Quarterly Report #1 was submitted are included in this report.

Results for re-analysis of certain previously collected bimonthly samples using low-level analysis will be reported in subsequent reports, pending receipt of data.

The results from the June 2019 and August 2019 events indicate that the intake water contains PFAS and this water is distributed widely throughout the Facility. The highest concentrations of PFAS were in Chemours process water samples which are containerized and disposed of offsite. In samples collected from discharges that reach Outfall 002 (Location 23A, the manhole at the Terra Cotta pipe, and Location 8, the effluent of the WWTP) were also observed to have elevated PFAS. PFAS associated with the WWTP and connections to the WWTP are being further evaluated.

Supplemental sampling programs identified previously (Geosyntec 2019b) to further refine PFAS contributions to Outfall 002 were conducted and are discussed in Appendix A. Preliminary results suggest that sediments in the Conveyance Network may contribute PFAS mass to Outfall 002.

### 5.1 Recommendations

Based on the observations from the supplemental and the August bimonthly sampling programs, it is recommended that temporal composite samples are collected at Locations 18 and 23A in future sampling events.

The source of elevated PFAS observed at Outfall 001 (Location 8) in the August sampling may have been related to maintenance and cleaning of a clarifier in the WWTP. The Terra Cotta pipe feeds into the WWTP and samples collected from this pipe have been found to contain PFAS. Portions of the Terra Cotta pipe have been decommissioned and the remaining portions of the Terra Cotta Pipe will be decommissioned in 2020. Further evaluations into the PFAS related to the WWTP will be considered and a supplemental sampling program developed.

It is also recommended that future bimonthly sampling events involve sample collection at Location 8 approximately one hydraulic residence time (24 hours) after sample collection at Location 22 and other upstream locations.

Samples collected and analyzed from Locations 16, 17A, and 17B during the June 2019 event had elevated PFAS concentrations, which is consistent with observations during the April 2019 event and expected as these are Chemours process wastewaters that are transported offsite for disposal. The process wastewater at these locations does not enter the site drainage system, nor does it reach Outfall 002. Consistent with the recommendation made during the first quarterly report (Geosyntec, 2019b), future Paragraph 11(c) sample collection is not planned at these locations as part of Paragraph 11(c) sampling and reporting activities.

**Notes**

Samples collected on 24 April 2019 (April 2019 event), 27 June 2019 & 28 June 2019 (June 2019 event), and 21 August 2019 & 22 August 2019 (August 2019 event).

Sample numbers refer to locations identified in Figure 2.

All temporal composite samples were integrated over 4 hours.

Locations 2, 3, 4, 5, 11, 12, and 13 were not sampled in 2019 Quarter 2 (Q2) because they had insufficient water to collect a sample.

Location 10 was not sampled during the June 2019 event because it had insufficient water to collect a sample.

Location 21B was not sampled in Q2 or Quarter 3 (Q3) because this sediment pond was not in use at the time of sampling.

Location 23B was added to the Sampling Plan after the April 2019 event. It was sampled during the June 2019 event but was not sampled during the August 2019 event because it had insufficient water to collect a sample.

Locations 2, 3, 4, 5, 11, and 13 were not sampled in Q3 because they had insufficient water to collect a sample.

Location 17A was not sampled in Q3 because it was removed from the work plan.

-- sample not collected

\* - Location 7B was collected as a grab sample for the April and June 2019 events due to limited autosampler availability. This location was collected as a temporal composite sample for the August 2019 event and will continue to be collected in this manner for future sampling events.

\*\* - Locations 18 and 23A were collected as four grab samples over four hours during the August 2019 event to assess temporal variability at these locations.

IXM - ion exchange membrane

NCCW - non-contact cooling water

PFAS - per- and polyfluoroalkyl substances

PPA - polymer processing aid

WWTP - Wastewater treatment plant

# Appendix A: Quarters 2 and 3 Supplemental Sampling Activities

31 October 2019

## APPENDIX A:

### QUARTERS 2 AND 3 SUPPLEMENTAL SAMPLING ACTIVITIES

The following supplemental sampling activities were conducted in Quarters 2 (April, May, June) and 3 (July, August, September) in 2019.

- Water and wastewater samples were collected from locations along the Terra Cotta pipe upstream and downstream of the wastewater treatment plant (WWTP) to gather additional data on PFAS concentrations in water that is processed at the WWTP before reaching Outfall 002.
- Supplemental Conveyance Network sampling (Cooling Water Channel and Open Channel to Outfall 002) was completed to screen the sediments in the channel as a possible secondary source of PFAS in Outfall 002. The samples were analyzed using a Table 3+ method for solids, which utilizes a solvent extraction process to quantify PFAS in the sediment.
- Supplemental dry weather water samples were collected along the Open Channel to Outfall 002 to evaluate if groundwater infiltration was affecting the variability of PFAS concentrations in the Open Channel.

Results from the supplemental sampling activities were previously discussed in the *Assessment of HFPO-DA and PFMOAA in Outfall 002 Discharge and Evaluation of Potential Control Options Report* (Geosyntec, 2019c); however, some data from TestAmerica were pending at the time of submission and data from the Chemours onsite laboratory in Fayetteville were presented in the interim. All results discussed herein are from TestAmerica. Test America laboratory analytical reports are provided in Appendix C.

#### **Wastewater Treatment Plant Sampling**

Wastewater samples were collected on July 16-18, 2019, from locations along the Terra Cotta pipe upstream and downstream of the WWTP to gather additional data on PFAS in water that is processed at the WWTP before reaching Outfall 002. Simultaneous 24-hour composite samples were collected at Locations 1, 18, 22, 23A-1, 23A-2, and 23A (Figure A.1). A composite sample

was also collected at Location 8, approximately one hydraulic residence time (24 hours) after the other locations. Sample locations are shown in Figure A.1 and PFAS results are provided in Table A.1. The intent of this one-time sampling event was to further understandings of the inputs from manufacturing areas to the WWTP. The findings of this sampling event are as follows:

- The water samples collected at Location 22 (the combined influent to the WWTP) reported elevated HFPO-DA and PFMOAA concentrations (HFPO-DA: 790 ng/L, J qualified; PFMOAA: 5,700 ng/L, J qualified), as well as elevated Byproduct 5 concentrations (58,000 ng/L, B qualified). This resulted in the highest reported Total Table 3+ concentration at Location 22 (96,000 ng/L). The concentrations reported at Location 22 are not similar to water samples collected and analyzed from upstream (Location 23A) or Outfall 001 (Location 8) sample locations. The autosampler at Location 22 became clogged with sediment, roughly 8 hours into the sampling event. The interference of sediment in the sampler makes it difficult to draw conclusions from this sampling event.
- HFPO-DA (12,000 ng/L, J qualified) was observed at Location 23A-1 (Kuraray SentryGlas® process wastewater) and at Location 22 (790 ng/L, J qualified; the WWTP combined influent). A lower concentration was observed at Location 8 (91 ng/L, Outfall 001).
- PFMOAA was observed at Location 23A (1,100 ng/L, combined Kuraray process water) and at Location 22 (5,700 ng/L, J qualified, the WWTP combined influent). PFMOAA was detected at 430 ng/L in Outfall 001 (Location 8).
- The elevated HFPO-DA observed in the sample collected from Location 23A-1 (12,000 ng/L, J qualified) does not appear to represent a significant source of mass loading to downstream Location 23A where the HFPO-DA concentration was 120 ng/L, J qualified.

Elevated HFPO-DA and PFMOAA concentrations at Location 22 may be due to the autosampler clogging with sediment; however, the magnitude of this interference cannot be evaluated without further sampling. The WWTP sampling program will be repeated. Elevated PFAS concentrations at Location 23A suggest that the remaining in use portions of the Terra Cotta pipe may continue to be a minor source of PFAS to the WWTP. Kuraray and Chemours are planning to decommission the remaining portion of the Terra Cotta pipe and replace it with an above ground pipe. After this action is completed, future characterization will help assess the results of this action, and whether additional sampling or characterization is needed.

## **Conveyance Network Sampling**

Supplemental Cooling Water Channel and Open Channel to Outfall 002 sampling was completed on July 3, 2019. The channels have sediments present in them at certain locations. Sediment samples were collected as a screening level evaluation to understand the potential for sediments to contribute to observed PFAS concentrations at Outfall 002 and to understand the potential benefit of removing sediment from the conveyance network. The samples were analyzed using a newly developed Table 3+ method for solids, which utilizes a solvent extraction to quantify PFAS in the sediment. Composite samples were created from sediment grab samples. The locations of these samples are show in Figure A.2 along with the total Table 3+ results for these samples. The PFAS results are summarized in Table A.2.

The total Table 3+ concentrations varied among sediment sample locations between 24,000 and 3,200,000 ng/kg. The highest total Table 3+ concentrations were observed at Location C (3,200,000 ng/kg), at the end of the cooling water channel before combining with the open channel (Figure A.2). This result was made up entirely of byproduct PFESA-BP1. Due to the elevated concentration of PFESA-BP1, dilution of the sample led to non-detects with elevated reporting limits for other analytes. The sample collected at Location F, in the cooling water channel south of Monomers IXM, had total Table 3+ concentration of 410,000 ng/kg, and was comprised of PFESA-BP1 and PFESA-BP2. The primary and duplicate samples collected at Location G, in the northwest corner of Monomers IXM, had lower total Table 3+ concentrations than the other locations (44,000 and 24,000 ng/kg, respectively) but these samples included detects for several PFAS. Nine PFAS were detected in the primary sample and seven PFAS were detected in the duplicate sample, including HFPO-DA and PFMOAA in both samples. These results suggest that sediments present in the Cooling Water Channel around the Monomers IXM Area contain PFAS and may represent a source of PFAS that can contribute to concentrations at Outfall 002.

Based on these results, sediment removal from the Cooling Water Channel and Open Channel to Outfall 002 was recommended as an action. During the October 2019 Plant Turn Around, sediment was removed from the Cooling Water Channel in the Monomers IXM Area and from the Open Channel to Outfall 002. Future characterization will help assess the results of this removal, and whether additional sampling is needed.

## **Open Channel to Outfall 002 Sampling**

Supplemental dry weather water samples were collected on May 30, 2019 along the Open Channel to Outfall 002 to evaluate whether possible groundwater infiltration was affecting the variability

of PFAS in the Open Channel. The samples were collected from along the Open Channel to Outfall 002 after the last conveyance network tributary joins the channel (Figure A.3). Samples at Locations 20B, 20C, and 20D were collected as spatial composite samples, where three grab samples were collected from just below the water surface using a dip rod at three points along the width of the open channel, then composited together in a stainless-steel vessel and poured into HDPE bottles. Downstream of Location 20D and Location 20, the sample at Location 20E was collected from within the sump at Outfall 002 as a grab sample using the autosampler at that location.

Concentrations of HFPO-DA and PFMOAA in the supplemental outfall channel samples are presented in Figure A.3. Sample results for all PFAS reported under Table 3+ Laboratory SOP and EPA Method 537 Mod are provided in Table A.3.

HFPO-DA concentrations in samples collected along the Open Channel, upstream of Outfall 002 (Locations 20B, 20C, and 20D) were either non-detect (reporting limit of 86 ng/L) or were detected between 89 ng/L and 130 ng/L. The sample collected at Location 20E, downstream of Outfall 002 in the sump, had detectable HFPO-DA at 110 ng/L.

The primary and duplicate samples at Location 20B, along with the samples at 20C, 20D, and 20E, do not conclusively show a pattern in HFPO-DA concentrations upstream to downstream along the Open Channel to Outfall 002. While the primary sample at Location 20B was not detected at a reporting limit of 86 ng/L and Locations 20C and 20D showed a slight increase downstream, the duplicate sample collected at Location 20B shows an HFPO-DA concentration higher than the furthest downstream Location 20E. The range of values (non-detect at reporting limit of 86 ng/L to 130 ng/L) are also within reasonable expectations of analytical variability.

Each of the supplemental outfall samples had elevated PFMOAA compared to results for Location 20 during April 2019, June 2019, and August 2019 events, ranging from 2,400 ng/L to 2,800 ng/L. Similar to HFPO-DA, the PFMOAA concentrations at locations upstream of Outfall 002 did not consistently show a pattern of being higher or lower than the PFMOAA reported at Location 20E, downstream of Outfall 002. Several other PFAS were elevated in the supplemental outfall samples that were non-detect or detected at much lower concentrations at Location 20 during the April 2019, June 2019, and August 2019 events. These observations are discussed in more detail in the *Observations of Elevated PFAS Concentrations at the Cape Fear River Intake and Outfall 002 Sample Locations in May and June 2019* (Geosyntec, 2019d).

Additional sampling may be recommended pending data from future bimonthly PFAS characterization events. As discussed previously, sediment removal from the Open Channel to Outfall 002 occurred during the October 2019 Plant Turn Around. Future characterization will help assess the results of this action, and whether additional dry weather data is needed to further understand what may be contributing to PFAS increases along the Open Channel portion of the network to Outfall 002.

## Appendix B: Field Parameters

31 October 2019

## APPENDIX B: FIELD PARAMETERS

Field parameters recorded during the April, June, and August 2019 events are provided in Table B.1 and Table B.2 for grab samples and temporal composite samples, respectively. Field parameters were measured using a Horiba U-52 model. The water quality meter was calibrated at the start of every sampling day, except for on August 21<sup>st</sup>, when the Turbidity meter could not be calibrated due to lack of proper calibration solution.

For grab samples during the April, June, and August 2019 events, field parameters were measured once prior to sampling using a flow through cell. For temporal composite samples during the April 2019 and August 2019 events, field parameters were measured twice using a flow through cell: once during composite sampling (collected directly from the water stream), and once after composite sampling (collected from the autosampler reservoir). For temporal composite samples during the June 2019 event, field parameters were measured from the autosampler reservoir after sampling.

Field parameter data from the April 2019 event were previously discussed in Characterization of PFAS Concentration in Process and Non-Process Wastewater and Stormwater: Quarterly Report #1 (Geosyntec, 2019b). Recorded field parameter data observed during the June and August 2019 events are generally in line with expectations for the sample locations, with the following exceptions:

- In June 2019, most locations had recorded pH between 6 and 9. Locations 18 and 22 had pH greater than or equal to 10. Location 22, the combined influent to the wastewater treatment plan (WWTP), had the highest measured pH at 11. Location 18, Kuraray process wastewater flowing to the WWTP, had measured pH at 10. The treated effluent pH from the WWTP at Location 8 was 6.9.
- In August 2019, most locations had recorded pH between 6 and 9. Location 6, Kuraray non-contact cooling water flowing to the WWTP, and Location 18, Kuraray process wastewater flowing to the WWTP, each had measured pH at 10. The treated effluent pH from the WWTP at location 8 was between 7.9 and 8.3.

- In August 2019, Location 23A, Kuraray SentryGlas® process water and non-contact cooling water flowing to the WWTP, had the lowest measured pH at 4.7. The treated effluent pH from the WWTP at Location 8 was between 7.9 and 8.3.
- In June 2019, Location 23B, Kuraray laboratory process wastewater flowing to the WWTP, had dissolved oxygen (DO) measured at 0 mg/L. Other field parameter data for this location were as expected; however, in general the DO measured for other grab sample locations were also low (2 mg/L – 5 mg/L) compared to the other bimonthly sampling events (April: 6 mg/L – 11 mg/L, June: 3 mg/L – 9 mg/L). Additional field calibration data for DO will be requested for the next sampling event to evaluate this further.

## Appendix D: Laboratory Reports and DVM Workbooks

*Laboratory Reports are provided on a USB memory storage drive that was shipped with the hard copies provided to NCDEQ*

## ADQM DATA REVIEW NARRATIVE

**Site**                   **Chemours FAY – Fayetteville**  
**Project**               **2019 Dry Stormwater Sampling (updated for completeness)**  
**Project Reviewer**   **Michael Aucoin, AECOM as a Chemours contractor**  
**Sampling Dates**     **April 24 - 25, 2019**

### **Analytical Protocol**

<b>Laboratory</b>	<b>Analytical Method</b>	<b>Parameter(s)</b>
TestAmerica - Sacramento	537 Modified	PFAS <sup>1</sup>
TestAmerica - Sacramento	Cl. Spec. Table 3 Compound SOP	Table 3+ compounds

<sup>1</sup> Perfluoroalkylsubstances, a list of 33 compounds including HFPO-DA.

### **Sample Receipt**

The following items are noted for this data set:

- All samples were received in satisfactory condition and within EPA temperature guidelines on April 26, 2019, except for a waste acid sample (LOC17A) received on May 17, 2019.
- Some samples were reactivated outside the laboratory established hold time to allow reanalysis by the low level Table 3+ method.

### **Data Review**

The electronic data submitted for this project was reviewed via the Data Verification Module (DVM) process.

Overall the data is acceptable for use without qualification, except as noted below:

- Non-detect results for PPF Acid in one sample were qualified R and are considered to be unusable due to very poor matrix spike (MS) relative percent recoveries (RPR). The lab revised reports to apply a Z qualifier for four Table 3+ compounds (DFSA, MMF, MTP, PPF Acid), indicating poor performance in the presence of matrix effects, including inconsistent sample results. The data reviewer qualified these analytical results J as estimated, and non-detect results were qualified UJ indicating an estimated reporting limit, unless the DVM had already applied a B or R qualifier. Subsequently DFSA, MMF, MTP, and PPF Acid were dropped from the method. These compounds were not reported for the waste acid sample.
- Professional judgement was used to overwrite R qualifiers, indicating an unusable result, that were assigned by the DVM due to very poor matrix recoveries for PFMOAA and MTP in one sample. The qualifiers were updated to UJ, indicating an estimated reporting limit, because the

surrogate compound was a measurable labeled isotope compound, which is used for quantitation and provides a sample specific recovery correction of the sample results.

- Some of the analytical results have been qualified B, and may be biased high, or may be a false positive, because an associated field or equipment blank contained a comparable concentration.
- Several analytical results have been qualified J as estimated, and non-detect results qualified UJ indicating an estimated reporting limit, due to poor recovery of surrogate, laboratory blank spike, or matrix spike compounds; sample preparation and/or analysis which exceeded the laboratory hold times; and poor laboratory blank spike, matrix spike, field duplicate or lab replicate precision. See the Data Verification Module (DVM) Narrative Report for which samples were qualified, the specific reasons for qualification, and potential bias in reported results.

#### **Attachments**

The DVM Narrative report is attached. The lab reports due to a large page count are stored on an AECOM network shared drive and are available to be posted on external shared drives, or on a flash drive.

## Data Verification Module (DVM)

The DVM is an internal review process used by the ADQM group to assist with the determination of data usability. The electronic data deliverables received from the laboratory are loaded into the Locus EIM™ database and processed through a series of data quality checks, which are a combination of software (Locus EIM™ database Data Verification Module (DVM)) and manual reviewer evaluations. The data is evaluated against the following data usability checks:

- Field and laboratory blank contamination
- US EPA hold time criteria
- Missing Quality Control (QC) samples
- Matrix spike(MS)/matrix spike duplicate (MSD) recoveries and the relative percent differences (RPDs) between these spikes
- Laboratory control sample(LCS)/control sample duplicate (LCSD) recoveries and the RPD between these spikes
- Surrogate spike recoveries for organic analyses
- RPD between field duplicate sample pairs
- RPD between laboratory replicates for inorganic analyses
- Difference / percent difference between total and dissolved sample pairs.

There are two qualifier fields in EIM:

**Lab Qualifier** is the qualifier assigned by the lab and may not reflect the usability of the data. This qualifier may have many different meanings and can vary between labs and over time within the same lab. Please refer to the laboratory report for a description of the lab qualifiers. As they are lab descriptors they are not to be used when evaluating the data.

**Validation Qualifier** is the 3rd party formal validation qualifier if this was performed. Otherwise this field contains the qualifier resulting from the ADQM DVM review process. This qualifier assesses the usability of the data and may not equal the lab qualifier. The DVM applies the following data evaluation qualifiers to analysis results, as warranted:

Qualifier	Definition
B	Not detected substantially above the level reported in the laboratory or field blanks.
R	Unusable result. Analyte may or may not be present in the sample.
J	Analyte present. Reported value may not be accurate or precise.
UJ	Not detected. Reporting limit may not be accurate or precise.

The **Validation Status Code** field is set to “DVM” if the ADQM DVM process has been performed. If the DVM has not been run, the field will be blank.

If the DVM has been run (**Validation Status Code** equals “DVM”), use the **Validation Qualifier**.

## DVM Narrative Report

**Site:** Fayetteville

**Sampling Program:** 2019 Dry Stormwater Sampling

**Validation Options:** LABSTATS

**Validation Reason**

Associated MS and/or MSD analysis had relative percent recovery (RPR) values less than the data rejection level. The reported non-detect result is unusable.

Site: Fayetteville

Sampling Program: 2019 Dry Stormwater Sampling

Validation Options: LABSTATS

**Validation Reason**

Only one surrogate has relative percent recovery (RPR) values outside control limits and the parameter is a PFC (Nondetects).

Field Sample ID	Date	Sampled Lab Sample ID	Analyte	Result	Units	Type	MDL	PQL	Validation Qualifier	Analytical Method	Pre-prep	Prep
	Sampled Date

## Validation Reason

Associated LCS and/or LCSD analysis had relative percent recovery (RPR) values less than the lower control limit but above 10%. The actual detection limits may be higher than reported.

Site: Fayetteville

Sampling Program: 2019 Dry Stormwater Sampling

Validation Options: LABSTATS

## Validation Reason

Associated LCS and/or LCSD analysis had relative percent recovery (RPR) values less than the lower control limit but above 10%. The actual detection limits may be higher than reported.

Site: Fayetteville

Sampling Program: 2019 Dry Stormwater Sampling

Validation Options: LABSTATS

## Validation Reason

The analysis hold time for this sample was exceeded by a factor of 2. The reporting limit may be biased low.

Site: Fayetteville

Sampling Program: 2019 Dry Stormwater Sampling

Validation Options: LABSTATS

## Validation Reason

High relative percent difference (RPD) observed between field duplicate and parent sample. The reported result may be imprecise.

Site: Fayetteville

Sampling Program: 2019 Dry Stormwater Sampling

Validation Options: LABSTATS

## Validation Reason

Only one surrogate has relative percent recovery (RPR) values outside control limits and the parameter is a PFC (Detects).

**Project**               **Additional Outfall Samples**  
**Project Reviewer**   **Michael Aucoin, AECOM as a Chemours contractor**  
**Sampling Dates**     **May 30, 2019**

**Analytical Protocol**

<b>Laboratory</b>	<b>Analytical Method</b>	<b>Parameter(s)</b>
TestAmerica - Sacramento	Cl. Spec. Table 3 Compound SOP	Table 3+ compounds

**Sample Receipt**

The following items are noted for this data set:

- All samples were received in satisfactory condition and within EPA temperature guidelines on June 1, 2019.

**Data Review**

The electronic data submitted for this project was reviewed via the Data Verification Module (DVM) process.

Overall the data is acceptable for use without qualification, except as noted below:

- All of the Table 3+ analytical results have been qualified J as estimated, and non-detect results qualified UJ indicating an estimated reporting limit, due to analysis which exceeded the laboratory established hold time. The result for Byproduct 5 in one sample was qualified J, and may be biased high, due to an MS RPR that exceeded criteria. See the Data Verification Module (DVM) Narrative Report for which samples were qualified, the specific reasons for qualification, and potential bias in reported results.

**Attachments**

The DVM Narrative report is attached. The lab report due to a large page count is stored on an AECOM network shared drive and is available to be posted on external shared drives, or on a flash drive.

## Data Verification Module (DVM)

The DVM is an internal review process used by the ADQM group to assist with the determination of data usability. The electronic data deliverables received from the laboratory are loaded into the Locus EIM™ database and processed through a series of data quality checks, which are a combination of software (Locus EIM™ database Data Verification Module (DVM)) and manual reviewer evaluations. The data is evaluated against the following data usability checks:

- Field and laboratory blank contamination
- US EPA hold time criteria
- Missing Quality Control (QC) samples
- Matrix spike(MS)/matrix spike duplicate (MSD) recoveries and the relative percent differences (RPDs) between these spikes
- Laboratory control sample(LCS)/control sample duplicate (LCSD) recoveries and the RPD between these spikes
- Surrogate spike recoveries for organic analyses
- RPD between field duplicate sample pairs
- RPD between laboratory replicates for inorganic analyses
- Difference / percent difference between total and dissolved sample pairs.

There are two qualifier fields in EIM:

**Lab Qualifier** is the qualifier assigned by the lab and may not reflect the usability of the data. This qualifier may have many different meanings and can vary between labs and over time within the same lab. Please refer to the laboratory report for a description of the lab qualifiers. As they are lab descriptors they are not to be used when evaluating the data.

**Validation Qualifier** is the 3rd party formal validation qualifier if this was performed. Otherwise this field contains the qualifier resulting from the ADQM DVM review process. This qualifier assesses the usability of the data and may not equal the lab qualifier. The DVM applies the following data evaluation qualifiers to analysis results, as warranted:

Qualifier	Definition
B	Not detected substantially above the level reported in the laboratory or field blanks.
R	Unusable result. Analyte may or may not be present in the sample.
J	Analyte present. Reported value may not be accurate or precise.
UJ	Not detected. Reporting limit may not be accurate or precise.

The **Validation Status Code** field is set to “DVM” if the ADQM DVM process has been performed. If the DVM has not been run, the field will be blank.

If the DVM has been run (**Validation Status Code** equals “DVM”), use the **Validation Qualifier**.

## ADQM DATA REVIEW NARRATIVE

<u>Site</u>	<b>Chemours FAY – Fayetteville</b>
<u>Project</u>	<b>2019 Sediment Sampling</b>
<u>Project Reviewer</u>	<b>Michael Aucoin, AECOM as a Chemours contractor</b>
<u>Sampling Dates</u>	<b>April 29 - 30, 2019</b> <b>July 2 - 3, 2019</b> <b>August 9, 2019</b>

### Analytical Protocol

<u>Laboratory</u>	<u>Analytical Method</u>	<u>Parameter(s)</u>
TestAmerica - Sacramento	537 Modified	PFAS <sup>1</sup> , total and SPLP
TestAmerica - Sacramento	Cl. Spec. Table 3 Compound SOP	Table 3+ compounds, total and SPLP
TestAmerica - Burlington	ASTM D422-63	Grain Size
TestAmerica - Sacramento	ASTM D2216-90	Percent Moisture
TestAmerica - Sacramento	ASTM D2216-90	Percent Solids

<sup>1</sup> Perfluoroalkylsubstances, a list of 33 compounds including HFPO-DA, or HFPO-DA alone.

### Sample Receipt

The following items are noted for this data set:

- All samples were received in satisfactory condition and within EPA temperature guidelines on:  
  
May 2, 2019  
July 9, 2019  
August 13, 2019
- The density results reported for soil samples do not represent the in-place density of the soil. The soil was received in a disturbed state and was subsequently molded in the laboratory to an approximation of the field environment

### Data Review

The electronic data submitted for this project was reviewed via the Data Verification Module (DVM) process.

Overall the data is acceptable for use without qualification, except as noted below:

- Non-detect results for R-EVE, Byproduct 4, and Byproduct 5 in some sediment samples were qualified R and should be considered to be unusable due to very poor matrix spike recoveries.
- Several analytical results have been qualified J as estimated, and non-detect results qualified UJ indicating an estimated reporting limit, due to poor recovery of a blank spike or matrix spike; sample preparation which exceeded the laboratory established hold time; and poor field duplicate or lab replicate precision. See the Data Verification Module (DVM) Narrative Report for which samples were qualified, the specific reasons for qualification, and potential bias in reported results.

#### **Attachments**

The DVM Narrative report is attached. The lab reports due to a large page count are stored on an AECOM network shared drive and are available to be posted on external shared drives, or on a flash drive.

## Data Verification Module (DVM)

The DVM is an internal review process used by the ADQM group to assist with the determination of data usability. The electronic data deliverables received from the laboratory are loaded into the Locus EIM™ database and processed through a series of data quality checks, which are a combination of software (Locus EIM™ database Data Verification Module (DVM)) and manual reviewer evaluations. The data is evaluated against the following data usability checks:

- Field and laboratory blank contamination
- US EPA hold time criteria
- Missing Quality Control (QC) samples
- Matrix spike(MS)/matrix spike duplicate (MSD) recoveries and the relative percent differences (RPDs) between these spikes
- Laboratory control sample(LCS)/control sample duplicate (LCSD) recoveries and the RPD between these spikes
- Surrogate spike recoveries for organic analyses
- RPD between field duplicate sample pairs
- RPD between laboratory replicates for inorganic analyses
- Difference / percent difference between total and dissolved sample pairs.

There are two qualifier fields in EIM:

**Lab Qualifier** is the qualifier assigned by the lab and may not reflect the usability of the data. This qualifier may have many different meanings and can vary between labs and over time within the same lab. Please refer to the laboratory report for a description of the lab qualifiers. As they are lab descriptors they are not to be used when evaluating the data.

**Validation Qualifier** is the 3rd party formal validation qualifier if this was performed. Otherwise this field contains the qualifier resulting from the ADQM DVM review process. This qualifier assesses the usability of the data and may not equal the lab qualifier. The DVM applies the following data evaluation qualifiers to analysis results, as warranted:

Qualifier	Definition
B	Not detected substantially above the level reported in the laboratory or field blanks.
R	Unusable result. Analyte may or may not be present in the sample.
J	Analyte present. Reported value may not be accurate or precise.
UJ	Not detected. Reporting limit may not be accurate or precise.

The **Validation Status Code** field is set to “DVM” if the ADQM DVM process has been performed. If the DVM has not been run, the field will be blank.

If the DVM has been run (**Validation Status Code** equals “DVM”), use the **Validation Qualifier**.

# DVM Narrative Report

**Site:** Fayetteville

**Sampling Program:** 2019 Sediment Sampling

**Validation Options:** LABSTATS

**Validation Reason**

Associated MS and/or MSD analysis had relative percent recovery (RPR) values less than the data rejection level. The reported non-detect result is unusable.

**ADQM DATA REVIEW  
NARRATIVE**

**Site**                   **Chemours FAY – Fayetteville**

**Project**               **2019 Stormwater Sampling (updated for completeness)**

**Project Reviewer**   **Michael Aucoin, AECOM as a Chemours contractor**

**Sampling Dates**      **June 27 - 28, 2019**  
                                **August 21 – 22, 2019**  
                                **September 6, 2019**

**Analytical Protocol**

<b>Laboratory</b>	<b>Analytical Method</b>	<b>Parameter(s)</b>
TestAmerica - Sacramento	537 Modified	PFAS <sup>1</sup>
TestAmerica - Sacramento	Cl. Spec. Table 3 Compound SOP	Table 3+ compounds
TestAmerica - Denver	200.7/200.8	Select metals
TestAmerica - Denver	300.0	Select anions
TestAmerica - Denver	351.2	Total Kjeldahl Nitrogen
TestAmerica - Denver	353.2	Nitrate/Nitrite Nitrogen
TestAmerica - Denver	365.1	Phosphorus
TestAmerica - Denver	410.4	Chemical Oxygen Demand (COD)
TestAmerica - Denver	2540 D-1997	Total Suspended Solids
TestAmerica - Denver	5210 B-2001	Biochemical Oxygen Demand (BOD) - 5 Day
TestAmerica - Denver	Calculation	Nitrogen, total

<sup>1</sup> Perfluoroalkylsubstances, a list of 33 or 37 compounds including HFPO-DA.

**Sample Receipt**

The following items are noted for this data set:

- All samples were received in satisfactory condition and within EPA temperature guidelines on:
  - July 2, 11, and 16, 2019
  - August 23, 2019
  - September 7, 2019
- Some samples were reactivated outside the laboratory established hold time to allow reanalysis by the low level Table 3+ method.

## **Data Review**

The electronic data submitted for this project was reviewed via the Data Verification Module (DVM) process.

Overall the data is acceptable for use without qualification, except as noted below:

- A result for phosphorous in field sample ID STW-LOC003-09061909 was qualified B and the reported result may be biased high, or a false positive, due to a comparable concentration found in the associated method blank.
- Several analytical results have been qualified J as estimated, and non-detect results qualified UJ indicating an estimated reporting limit, due to poor or very poor recovery of a surrogate or laboratory blank spike; sample analysis which exceeded the laboratory hold time; and poor field duplicate or lab replicate precision. See the Data Verification Module (DVM) Narrative Report for which samples were qualified, the specific reasons for qualification, and potential bias in reported results.

## **Attachments**

The DVM Narrative report is attached. The lab reports due to a large page count are stored on an AECOM network shared drive and are available to be posted on external shared drives, or on a flash drive.

## Data Verification Module (DVM)

The DVM is an internal review process used by the ADQM group to assist with the determination of data usability. The electronic data deliverables received from the laboratory are loaded into the Locus EIM™ database and processed through a series of data quality checks, which are a combination of software (Locus EIM™ database Data Verification Module (DVM)) and manual reviewer evaluations. The data is evaluated against the following data usability checks:

- Field and laboratory blank contamination
- US EPA hold time criteria
- Missing Quality Control (QC) samples
- Matrix spike(MS)/matrix spike duplicate (MSD) recoveries and the relative percent differences (RPDs) between these spikes
- Laboratory control sample(LCS)/control sample duplicate (LCSD) recoveries and the RPD between these spikes
- Surrogate spike recoveries for organic analyses
- RPD between field duplicate sample pairs
- RPD between laboratory replicates for inorganic analyses
- Difference / percent difference between total and dissolved sample pairs.

There are two qualifier fields in EIM:

**Lab Qualifier** is the qualifier assigned by the lab and may not reflect the usability of the data. This qualifier may have many different meanings and can vary between labs and over time within the same lab. Please refer to the laboratory report for a description of the lab qualifiers. As they are lab descriptors they are not to be used when evaluating the data.

**Validation Qualifier** is the 3rd party formal validation qualifier if this was performed. Otherwise this field contains the qualifier resulting from the ADQM DVM review process. This qualifier assesses the usability of the data and may not equal the lab qualifier. The DVM applies the following data evaluation qualifiers to analysis results, as warranted:

Qualifier	Definition
B	Not detected substantially above the level reported in the laboratory or field blanks.
R	Unusable result. Analyte may or may not be present in the sample.
J	Analyte present. Reported value may not be accurate or precise.
UJ	Not detected. Reporting limit may not be accurate or precise.

The **Validation Status Code** field is set to “DVM” if the ADQM DVM process has been performed. If the DVM has not been run, the field will be blank.

If the DVM has been run (**Validation Status Code** equals “DVM”), use the **Validation Qualifier**.

## DVM Narrative Report

Site: Fayetteville

Sampling Program: 2019 Stormwater Sampling

Validation Options: LABSTATS

**Validation Reason**

Contamination detected in Method Blank(s). Sample result does not differ significantly from the analyte concentration detected in the associated method blank(s).

## Validation Reason

Associated LCS and/or LCSD analysis had relative percent recovery (RPR) values less than the lower control limit but above 10%. The actual detection limits may be higher than reported.

Sampling Program: 2019 Stormwater Sampling

Validation Options: LABSTATS

## Validation Reason

High relative percent difference (RPD) observed between field duplicate and parent sample. The reported result may be imprecise.

## ADQM DATA REVIEW NARRATIVE

**Site**                   **Chemours FAY – Fayetteville**  
**Project**               **2019 WWTP 24 HOUR COMPOSITE**  
**Project Reviewer**   **Michael Aucoin, AECOM as a Chemours contractor**  
**Sampling Dates**     **September 16, 2019**

### **Analytical Protocol**

<b>Laboratory</b>	<b>Analytical Method</b>	<b>Parameter(s)</b>
Eurofins Lancaster	537 Modified	PFAS <sup>1</sup>
Eurofins Lancaster	Cl. Spec. Table 3 Compound SOP	Table 3+ compounds

<sup>1</sup> Perfluoroalkylsubstances, a list of 36 compounds including HFPO-DA.

### **Sample Receipt**

The following items are noted for this data set:

- All samples were received in satisfactory condition and within EPA temperature guidelines on September 18, 2019.

### **Data Review**

The electronic data submitted for this project was reviewed via the Data Verification Module (DVM) process.

Overall the data is acceptable for use without qualification, except as noted below:

- Results for PFO4DA, PFO5DA, and Byproduct 5 in field sample ID WWTP-LOC22-071619 have been qualified B, and may be biased high, or may be false positives, because an associated lab method blank contained a comparable concentration.
- Analytical results have been qualified J as estimated, and non-detect results qualified UJ indicating an estimated reporting limit, due to poor recovery of surrogate, laboratory blank spike, or matrix spike compounds; sample preparation and/or analysis which exceeded the laboratory hold times; and poor field duplicate or lab replicate precision. See the Data Verification Module (DVM) Narrative Report for which samples were qualified, the specific reasons for qualification, and potential bias in reported results.

**Attachments**

The DVM Narrative report is attached. The lab report due to a large page count is stored on an AECOM network shared drive and is available to be posted on external shared drives, or on a flash drive.

## Data Verification Module (DVM)

The DVM is an internal review process used by the ADQM group to assist with the determination of data usability. The electronic data deliverables received from the laboratory are loaded into the Locus EIM™ database and processed through a series of data quality checks, which are a combination of software (Locus EIM™ database Data Verification Module (DVM)) and manual reviewer evaluations. The data is evaluated against the following data usability checks:

- Field and laboratory blank contamination
- US EPA hold time criteria
- Missing Quality Control (QC) samples
- Matrix spike(MS)/matrix spike duplicate (MSD) recoveries and the relative percent differences (RPDs) between these spikes
- Laboratory control sample(LCS)/control sample duplicate (LCSD) recoveries and the RPD between these spikes
- Surrogate spike recoveries for organic analyses
- RPD between field duplicate sample pairs
- RPD between laboratory replicates for inorganic analyses
- Difference / percent difference between total and dissolved sample pairs.

There are two qualifier fields in EIM:

**Lab Qualifier** is the qualifier assigned by the lab and may not reflect the usability of the data. This qualifier may have many different meanings and can vary between labs and over time within the same lab. Please refer to the laboratory report for a description of the lab qualifiers. As they are lab descriptors they are not to be used when evaluating the data.

**Validation Qualifier** is the 3rd party formal validation qualifier if this was performed. Otherwise this field contains the qualifier resulting from the ADQM DVM review process. This qualifier assesses the usability of the data and may not equal the lab qualifier. The DVM applies the following data evaluation qualifiers to analysis results, as warranted:

Qualifier	Definition
B	Not detected substantially above the level reported in the laboratory or field blanks.
R	Unusable result. Analyte may or may not be present in the sample.
J	Analyte present. Reported value may not be accurate or precise.
UJ	Not detected. Reporting limit may not be accurate or precise.

The **Validation Status Code** field is set to “DVM” if the ADQM DVM process has been performed. If the DVM has not been run, the field will be blank.

If the DVM has been run (**Validation Status Code** equals “DVM”), use the **Validation Qualifier**.

## DVM Narrative Report

**Site:** Fayetteville

**Sampling Program:** 2019 WWTP 24 HOUR COMPOSITE

**Validation Options:** LABSTATS

**Validation Reason**

Contamination detected in Method Blank(s). Sample result does not differ significantly from the analyte concentration detected in the associated method blank(s).

Field Sample ID	Date	Sampled Lab Sample ID	Analyte	Result	Units	Type	MDL	PQL	Validation Qualifier	Analytical Method	Pre-prep	Prep
	Sampled										Pre-prep	Prep

## Validation Reason

Associated LCS and/or LCSD analysis had relative percent recovery (RPR) values less than the lower control limit but above 10%. The actual detection limits may be higher than reported.

**Site:** Fayetteville

**Sampling Program:** 2019 WWTP 24 HOUR COMPOSITE

**Validation Options:** LABSTATS

**Validation Reason**

The analysis hold time for this sample was exceeded by a factor of 2. The reported result may be biased low.

**Site:** Fayetteville

**Sampling Program:** 2019 WWTP 24 HOUR COMPOSITE

**Validation Options:** LABSTATS

**Validation Reason**

Associated LCS and/or LCSD analysis had relative percent recovery (RPR) values less than the lower control limit. The reported result may be biased low.
